GUIDELINES:

1. Any tech stack is allowed. No limitations on language and frameworks.
2. Focus on clarity, usability, and problem understanding.
3. Feel Free to add your own features. No limitations on creativity until its sticking to the topic.
4. Intermediate level features must be taken up only after basic items are built.
5. Advanced features should enhance, not overcomplicate.

PROBLEM STATEMENTS

1. AI-Driven Zero Trust Security for SMEs (Small and medium-sized enterprises)

Problem Statement:

Develop an AI-powered Zero Trust security framework tailored for SMEs that can continuously authenticate users, monitor access behaviour, and detect anomalies indicative of potential threats.

2. QuickPhish – Browser Extension for Instant Phishing Link Warnings:

Problem Statement:

Develop a Chrome and Edge browser extension that intercepts links clicked in web-based Gmail and Outlook, checks them against a free threat-intelligence API (such as PhishTank), and displays an in-page warning if the link is malicious before allowing redirection.

3. Intelligent Document Summarization for Technical Reports

Problem Statement:

Develop a software-based AI/ML model that automatically summarizes technical reports, emphasizing important findings, conclusions, and actionable insights.

4. AI-Driven Employee Productivity Monitoring in Hybrid Work Environments

Problem Statement:

Develop a software-based system that uses AI and data analytics to monitor and evaluate employee productivity in remote or hybrid settings.

5. Promoting Food Discipline and Conscious Eating Through AI-Driven Behavioural Nudges

Problem Statement:

Develop a software-based application that uses AI to promote food discipline by tracking eating patterns, suggesting healthier alternatives, and providing personalized nudges or feedback.

6. VisionTalk – Conversational Image Recognition Chatbot for the Visually Impaired

Problem Statement:

Design and build a chatbot that accepts images and engages in a meaningful conversation with users about the content.

7. AI-Generated Mental Health Companion

Problem Statement:

Design a 24/7 AI-based mental health chatbot that can empathetically engage with users in distress, detect emotional cues through natural language processing (NLP), suggest

mindfulness practices, and connect users with further self-help or professional resources—without attempting diagnosis or replacing licensed therapy.

8. PriceTracker – Price Drop Notifier

Problem Statement:

Develop a Python-based service that periodically scrapes e-commerce product pages (using a provided list of URLs), tracks price fluctuations using BeautifulSoup, and alerts users via email when a price drop is detected compared to the previous run.

9. Virtual Shopping Assistant for the Visually Impaired

Problem Statement:

There is a lack of comprehensive, voice-guided tools that enable visually impaired users to independently browse and shop online with confidence and efficiency.

10.AI-Powered Customer Support for Banking Services

Problem Statement:

Build an AI-powered chatbot that diagnoses tech issues (OS, banking software, mobile apps) by asking smart, context-based questions and guiding users through step-by-step solutions. It continuously learns from past interactions and seamlessly escalates complex cases to human agents when needed.

11.AI-Based Legal Literacy Platform

Problem Statement:

Most citizens are unfamiliar with their legal rights and struggle to comprehend legal language, which creates a barrier to justice and civic empowerment.

12.Open Contract Validator

Problem Statement:

Design a tool that can analyze legal contracts to detect, flag, and explain suspicious or biased terms using clause-based comparisons and AI.

13.Green Cloud Optimizer

Problem Statement:

Design and develop a tool that allows DevOps teams to monitor, analyze, and reduce the energy usage and associated emissions of their CI/CD pipelines.

14.Automated Defect Detection in Manufacturing Imagery

Problem Statement:

Develop a software-based AI/ML model that can automatically detect and classify defects in images of manufactured components.

15.Symptom awareness & first response guidance app

Problem Statement:

Create an app that helps users understand common symptoms and when to seek medical help.

16.Smart attendance and engagement tracker for colleges

Problem Statement:

Build a simple app that helps colleges track student attendance and basic engagement without expensive hardware and internet dependency.

17.Personalized learning companion for first-generation students

Problem Statement:

Create a learning companion app that helps students what to study, when to study and how to improve.

18.Digital health records and appointment system for RMP Clinics

Problem Statement:

Build a lightweight system that helps small clinics manage patient records and appointments digitally.

19.AI-Driven Personalized Treatment System Based on Genetic Profile and Health Records

Problem Statement:

Develop an AI-powered system that uses a patient's genetic profile and health records (e.g., medical history, current conditions, lifestyle factors) to generate personalized treatment recommendations.

20.Farmer crop planning and advisory tool

Problem Statement:

Build a digital assistant that helps farmers decide what to grow and how to manage crops.
